Download

The Dalvik virtual machine is provided for devices running Android 3.0 and above. The VM is provided as a free download. Features Dalvik 2.0 introduces a feature called 'Ahead-of-Time' compilation, which can significantly reduce the size of applications. Compiling from source code is typically much slower than generating bytecode. Android has historically supported JIT compilation, where the Java virtual machine (JVM) was run on the device itself. This was not very efficient, however. Dalvik 2.0 is said to provide faster compilation and execution, and to be an order of magnitude faster than the Java JVM on x86 devices. In addition, Dalvik 2.0 provides features for memory management, more efficient handling of heap and stack space, improved garbage collection, support for custom class loaders, improved support for JSR 45, better support for Android 3.0+, better support for different Dalvik versions on the same device, and improvements to Virtual Machine mode support. Dalvik 2.0 does not require Android 3.0+, but does require a class of device's CPU, FPU and floating point performance to be equal to Android 3.0+ requirements.
